

## 1. What is Bootstrap?

Bootstrap is a popular front-end framework that provides pre-designed components and a grid system for building responsive, mobile-first websites. It simplifies web development by offering ready-to-use CSS and JavaScript components.

## 2. How do you use Bootstrap containers?

Bootstrap containers help center and constrain content within the page. Use `.container` for a fixed-width layout and `.container-fluid` for a full-width layout.

Example:

```
<div class="container">Content</div>
<div class="container-fluid">Full-width Content</div>
```

## 3. How do you use Bootstrap in Typography?

Bootstrap offers classes for typography like heading sizes, text alignment, and font styles. You can use classes like `text-center`, `fw-bold`, and `fst-italic` to style text.

Example:

```
<h1 class="text-center text-primary">Heading</h1>
<p class="fw-bold">Bold Text</p>
```

## 4. How do you use Bootstrap in Colors?

Bootstrap provides utility classes to apply predefined colors to text, backgrounds, and borders. Use classes like `text-primary`, `bg-success`, and `border-danger` to change colors.

Example:

```
<h1 class="text-danger">Red Text</h1>
<p class="bg-warning text-dark">Yellow Background</p>
```
